Matched Prism U-Net and V5 MSE training

Same COCO split, degradations, crops, optimizer, schedule, seed, and 100-epoch horizon

Epoch 100: training MSE $= 5.723e-05$ (Prism) and $= 6.220e-05$ (V5); validation chroma L1 $= 0.003848$ (Prism) and $= 0.004008$ (V5).

The Prism log does not contain aggregate validation MSE, so panel (b) uses the held-out chroma L1 metric recorded by both runs; no missing metric is inferred.
